1. Which are the top three variables in your model which contribute most towards the probability of a lead getting converted?

Answer:- Based on the logistic regression model coefficients, the following variables…

Top 3 Variables Contributing to Lead Conversion:-

The top three variables that contribute the most towards the probability of a lead getting converted are:

i> **Total Time Spent on Website**
This is the most significant factor. Leads who spend more time on the website are more engaged and show higher interest in the course offerings, which increases their likelihood of conversion.

ii> **Total Visits**
The number of visits indicates repeated interest. Leads who visit the website multiple times are more likely to convert as they are actively exploring the offerings.

iii> **Lead Source**
The origin of the lead plays a crucial role. Certain sources such as Google or Direct Traffic tend to generate higher-quality leads, which have a greater probability of conversion compared to others.

2. What are the top 3 categorical/dummy variables in the model which should be focused the most on in order to increase the probability of lead conversion?

Answer:- Based on the model's dummy variable analysis…

Top 3 Categorical/Dummy Variables Affecting Lead Conversion:-

The top three categorical (dummy) variables that significantly influence the probability of lead conversion are:

i> **Lead Source (e.g., Google, Direct Traffic)**
Leads generated through specific sources such as Google or Direct Traffic tend to have a higher conversion probability. These sources bring in more relevant and high-intent users, making them more likely to convert.

ii> **Last Activity (e.g., Email Opened, SMS Sent)**
The recent activity of a lead is a strong indicator of engagement. Leads who have recently interacted with emails or messages show higher interest and are more likely to convert.

iii> **Specialization / Course Interest**
Leads who have clearly specified their area of interest or specialization are more likely to convert, as they have a defined purpose and intent behind their interaction.

3. X Education has a period of 2 months every year during which they hire some interns. The sales team, in particular, has around 10 interns allotted to them. So during this phase, they wish to make the lead conversion more aggressive. So they want almost all of the potential leads (i.e. the customers who have been predicted as 1 by the model) to be converted and hence, want to make phone calls to as much of such people as possible. Suggest a good strategy they should employ at this stage.

Answer:- **Strategy to Increase Lead Conversion During Internship Period:-**

During the internship period, the objective is to maximize lead conversion by targeting as many potential leads as possible. Since additional resources (interns) are available, X Education can adopt a more aggressive strategy.
The most effective approach would be to **lower the lead score threshold** used for classifying leads as potential customers. Normally, a higher threshold (e.g., 0.7) is used to focus only on high-quality leads. However, during this period, the company can reduce the threshold (e.g., to 0.3–0.4) to include a larger pool of leads.
This strategy will increase the number of leads classified as "hot leads," allowing the sales team to reach out to more customers. Since there are additional interns available to handle the workload, the company can afford to contact a broader audience.
Additionally, the sales team should:

- Prioritize leads with medium to high engagement levels
- Use quick follow-ups to capture interest
- Leverage interns for initial outreach calls and emails

This approach ensures that:

- Maximum leads are contacted
- Conversion opportunities are not missed
- Resources are utilized efficiently

Overall, by lowering the threshold and increasing outreach efforts, X Education can significantly boost conversions during this high-capacity period.
This approach increases recall by capturing more potential leads.

4. Similarly, at times, the company reaches its target for a quarter before the deadline. During this time, the company wants the sales team to focus on some new work as well. So during this time, the company's aim is to not make phone calls unless it's

extremely necessary, i.e. they want to minimize the rate of useless phone calls. Suggest a strategy they should employ at this stage.

Answer:- **Strategy to Minimize Unnecessary Phone Calls:-**

During this phase, the company's objective is to reduce unnecessary efforts and avoid making phone calls unless the lead has a very high probability of conversion. Therefore, the company should adopt a more selective and conservative approach.

The most effective strategy would be to **increase the lead score threshold** used for classifying potential leads. Instead of using a lower threshold, the company can raise it (e.g., to 0.8 or 0.9), ensuring that only the most promising leads are targeted.

This approach will significantly reduce the number of leads classified as "hot leads," allowing the sales team to focus only on high-quality prospects. As a result, unnecessary calls to low-potential leads can be avoided.

Additionally, the company can:

- Focus only on highly engaged leads with strong activity
- Use automated emails or marketing campaigns for low and medium potential leads
- Allocate sales team efforts to other strategic tasks

This ensures that:

- Sales resources are used efficiently
- Unnecessary outreach is minimized
- Only high-probability leads are contacted

Overall, by increasing the threshold and targeting only top-quality leads, X Education can reduce effort while maintaining conversion efficiency.

This approach improves precision by focusing only on high-quality leads.
